

Figma fixes for the designer

Two categories: things that break emitted tokens, and things that fail the validation gate. Everything else is cosmetic and handled by the sync.

1. Broken tokens (fix these first)

Where	Problem	Fix
<code>typography > body > font-weight</code>	Value is "String value" (Figma's default placeholder)	Set to <code>regular</code> or <code>400</code>
<code>typography > h1 > background</code>	A color variable living in the typography collection	Delete it. Type metrics only. If h1 needs a background, it belongs in <code>colors-semantic</code>

2. Name inconsistencies

The sync lowercases and hyphenates automatically, so these don't break the build. But they make the Figma file read inconsistently. Fix while the library is young.

Collection	Current	Rename to
<code>colors-brand</code>	<code>neutral/cool gray</code>	<code>neutral/cool-gray</code>
<code>colors-primitive</code>	<code>neutral/gray/Gray-50</code>	<code>neutral/gray/gray-50</code>
<code>colors-primitive</code>	<code>neutral/gray/Gray-950</code>	<code>neutral/gray/gray-950</code>
<code>colors-semantic</code>	<code>foreground/heading light</code>	<code>foreground/heading-light</code>
<code>layout</code>	<code>spacing/extra large</code>	<code>spacing/extra-large</code>
<code>layout</code>	<code>spacing/2X large</code>	<code>spacing/2x-large</code>
<code>layout</code>	<code>spacing/3x large</code>	<code>spacing/3x-large</code>
<code>layout</code>	<code>spacing/4X large</code>	<code>spacing/4x-large</code>
<code>typography</code>	<code>h2 small</code>	<code>h2-small</code>

Convention: lowercase, hyphenated, no spaces. Also normalise font-weight values to lowercase (`heavy` not `Heavy`, `bold` not `Bold`).

3. Aliasing defects

These semantic tokens are bound to raw hex values instead of aliasing a primitive. They work today but break on rebrand.

Token	Current	Fix
<code>color.foreground.card-border</code>	Raw transparent white	Bind to a <code>colors-primitive</code> variable, or delete the token if transparent is the intent

Token	Current	Fix
<code>color.foreground.surface-text-bg</code>	Raw <code>#f3f4f6</code> / <code>#ffffff</code> (not in UCSD palette)	Rebind to <code>neutral/gray/gray-50</code> or another primitive

4. Dark-mode contrast failures

All four fail WCAG 2.2 AA (needs 4.5:1).

Token (dark mode)	Ratio	Fix
<code>color.foreground.body-text</code> on <code>color.surface.2</code>	4.00:1	Lighten body-text to <code>gray-300</code> , or darken surface-2
<code>color.component.btn-label-tertiary</code> on <code>color.component.btn-tertiary</code>	3.25:1	Darken the tertiary fill, or use a dark label
<code>color.component.menu</code> on <code>color.surface.1</code>	3.70:1	Lighten menu to <code>gray-400</code> or above
<code>color.system.foreground-information</code> on <code>color.system.bg-information</code>	2.79:1	Darken <code>bg-information</code> in dark mode (success/warning/error pairs already do this)

After fixing

Re-export the changed collections (right-click each collection, Export modes) and send the ZIPs. We run the sync, review the diff, and open a PR. The validation gate checks aliases, mode parity, and contrast automatically.
